TRAINING ON RENEWABLE ENERGY MINI-GRIDS

Session 1 : Grid and mini-grid fundamentals

ISA/Government of Tonga/PCREEE/INES

15 November 2021

Introduction

Training on Renewable Energy Mini-Grids

Day 1

Session 1: Grid and mini-grid fundamentals

Session 2: Why Solar PV Mini-grid is a promising alternative for conventional power generation in Tonga

Session 3: How to select components that suit the Tonga/Pacific Islands context ?

Day 2

Session 4: PV system and storage predesign

Session 5: Commissioning on the ground

Session 6: Optimizing maintenance

Content of session 1

- Introduction
- Island grids and diesel generator sets
- Integration of PV into diesel mini-grids
- Mini-grid architectures
- Voltage drops

Electricity production in small islands

- Most common way to produce electricity : Diesel generator sets (gensets)

Kaledupa
(source: energynautic)

Bequia
(source : P. Blechinger)

Advantages of Diesel gensets

- Low capital cost
- “Grid forming” generators
(don't need any other generator to run)
- Power production automatically matches consumption

Daily power consumption profile

Diesel only

Genset

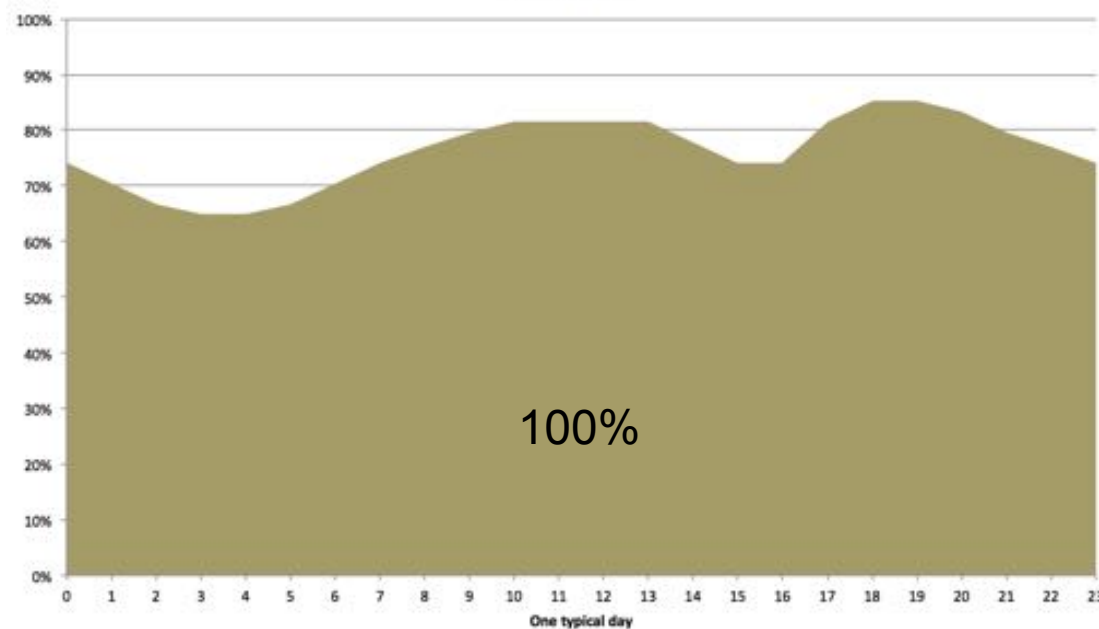

Mini-grid

Diesel only

Loads

Electricity production in small islands

Example : Adamstown (Pitcairn)

- Annual consumption : 150.000 kWh (estimated)
- 4 diesel gensets located in a power station

Disadvantages of Diesel gensets

- High operating cost
- Volatile price of Diesel
- On-site delivery (access, theft)
- High environmental impacts
- Low power quality

Rationales to switch from diesel to solar

(source : SMA)

(source : Delta)

Environmental / Social / Economical

Rationales to switch from diesel to solar

Reduction of oil spill risk / reduction of CO2 emissions

- Rennell Island (Solomon Islands)
- Shipwreck of MV Solomon Trader in February 2019
- 300 tonnes of heavy fuel oil

Rationales to switch from diesel to solar

Improvement of the quality of supply with less power outages

- Adamstown (Pitcairn)
- Diesel gensets are off from 10pm to 6am !
- Emergency genset for the Hospital and the Satellite station runs 24 hours

Mean daily load curve

Rationales to switch from diesel to solar

Reduction of the electricity generation cost

- Wallis-et-Futuna (France)
- 7 gensets – 6,8 MW (Wallis) + 4 gensets – 1,7 MW (Futuna)
- Production cost of approx. 230\$/MWh
- Price paid by consumers : 153\$/MWh !

(source : EEWF)

(source : CRE)

Advantages of photovoltaic systems

- No fuel needed (except the sun !)
- Low environmental impacts
- Low operating cost
- Low production cost compared to Diesel (0,05-0,2 USD/kWh)
- High quality of the power delivered

Disadvantages of photovoltaic systems

- High capital cost
- Land use
- “Grid following” generators
(need another generator to run)

Operation of gensets with PV

Underloading impacts gensets negatively

Hosting capacity of Diesel Island grids : « *Operating a diesel generator set at load levels less than **30 percent** of rated output for extended time periods impacts the unit negatively.* »

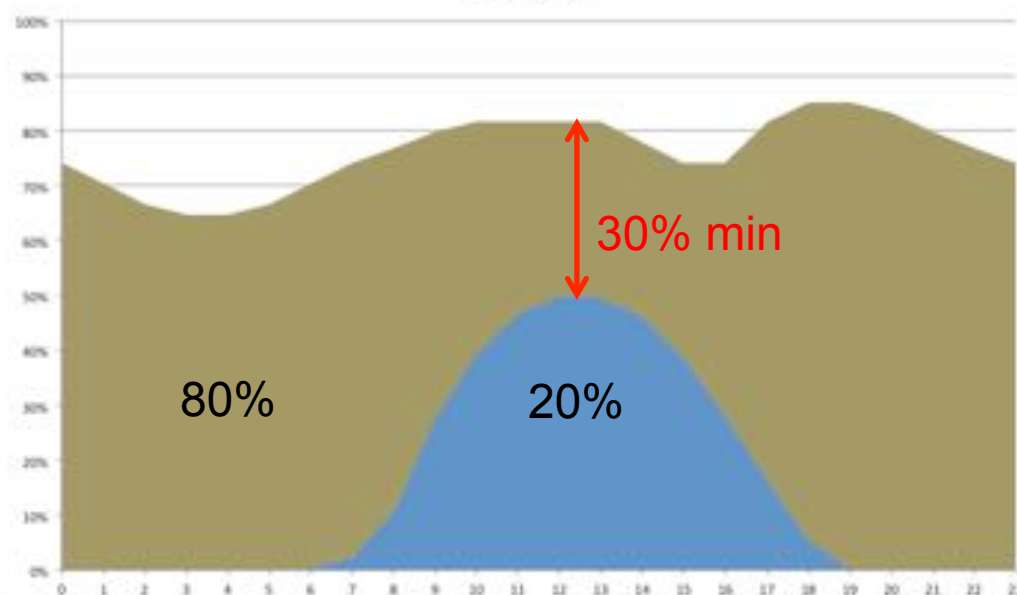

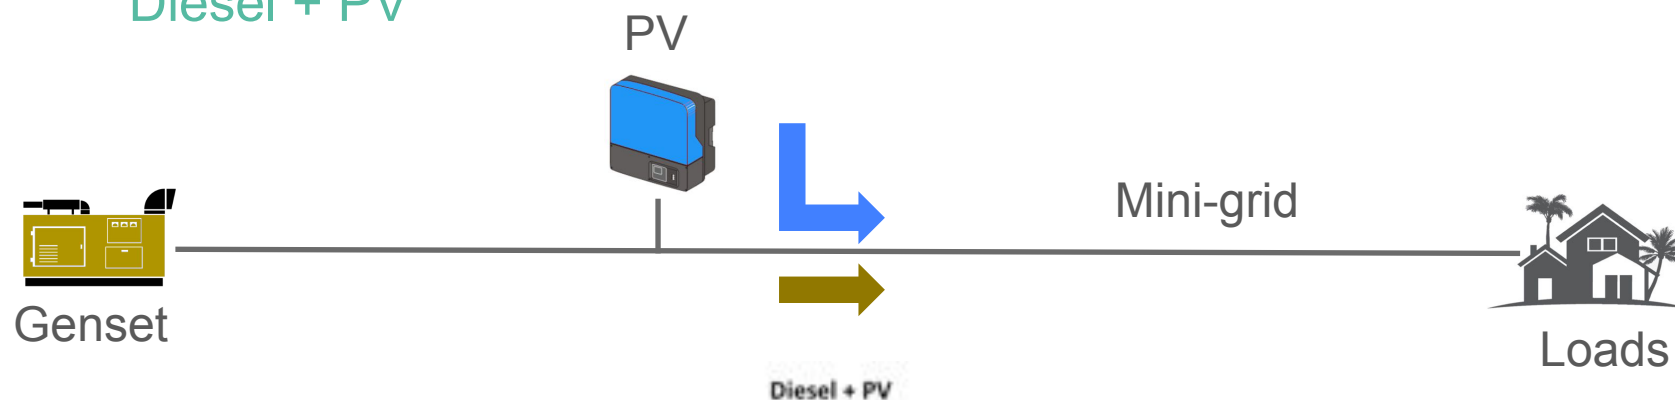

The Impact of Generator Set Underloading

Brian Jabeck
Electric Power, Caterpillar Inc.

CATERPILLAR

Daily power consumption profile

Diesel + PV

Daily power consumption profile

Diesel + PV

Oversizing of PV ...

will lead to massive curtailments !

Added value of storage

- Improvement of the power quality
- “Grid forming” generators

Added value of storage

Improvement of the power quality

Frequency of a 50Hz Gensets

Frequency of a 50Hz grid with storage

→ Genset back-up in case of power outage

→ Stabilisation of the frequency

Added value of storage

“Grid forming” generators that can replace gensets

Daily power consumption profile

Diesel + PV + Storage

Small storage

Daily power consumption profile

Diesel + PV + Storage

Medium storage

Diesel off
14 hours

Daily power consumption profile

Diesel + PV + Storage

Energy supply of Islands with solar PV

- 0-25% of yearly consumption covered by solar PV easily achievable
- 25-100% of yearly consumption covered by PV requires additional investments

Mini-grids ?

Various approaches

Stand-alone PV systems

Mini-grids ?

Stand-alone based architecture

- One inverter/charger connected to the PV modules, the storage (lead-acid) and a back-up genset (optional)

Mini-grids ?

Stand-alone based architecture

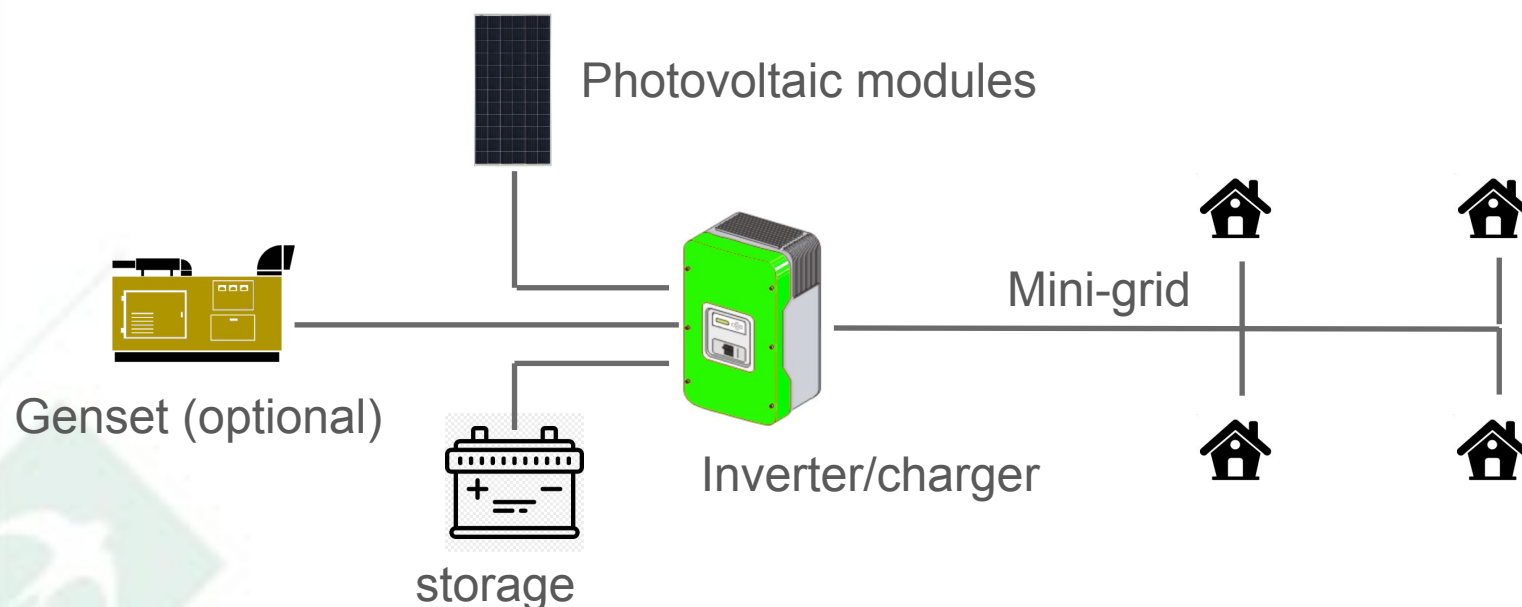

- One inverter/charger connected to the PV modules, the storage (lead-acid) and a back-up genset (optional)

Mini-grids ?

Stand-alone based architecture

- One inverter/charger connected to the PV modules, the storage (lead-acid) and a back-up genset (optional)

Mini-grids ?

Stand-alone based architecture

- One inverter/charger connected to the PV modules, the storage (lead-acid) and a back-up genset (optional)
- Example : Nukunonu (Tokelau)
 - 265 kWp PV system
 - 2,3 MWh storage (lead-acid)
 - 91% of annual consumption covered by solar

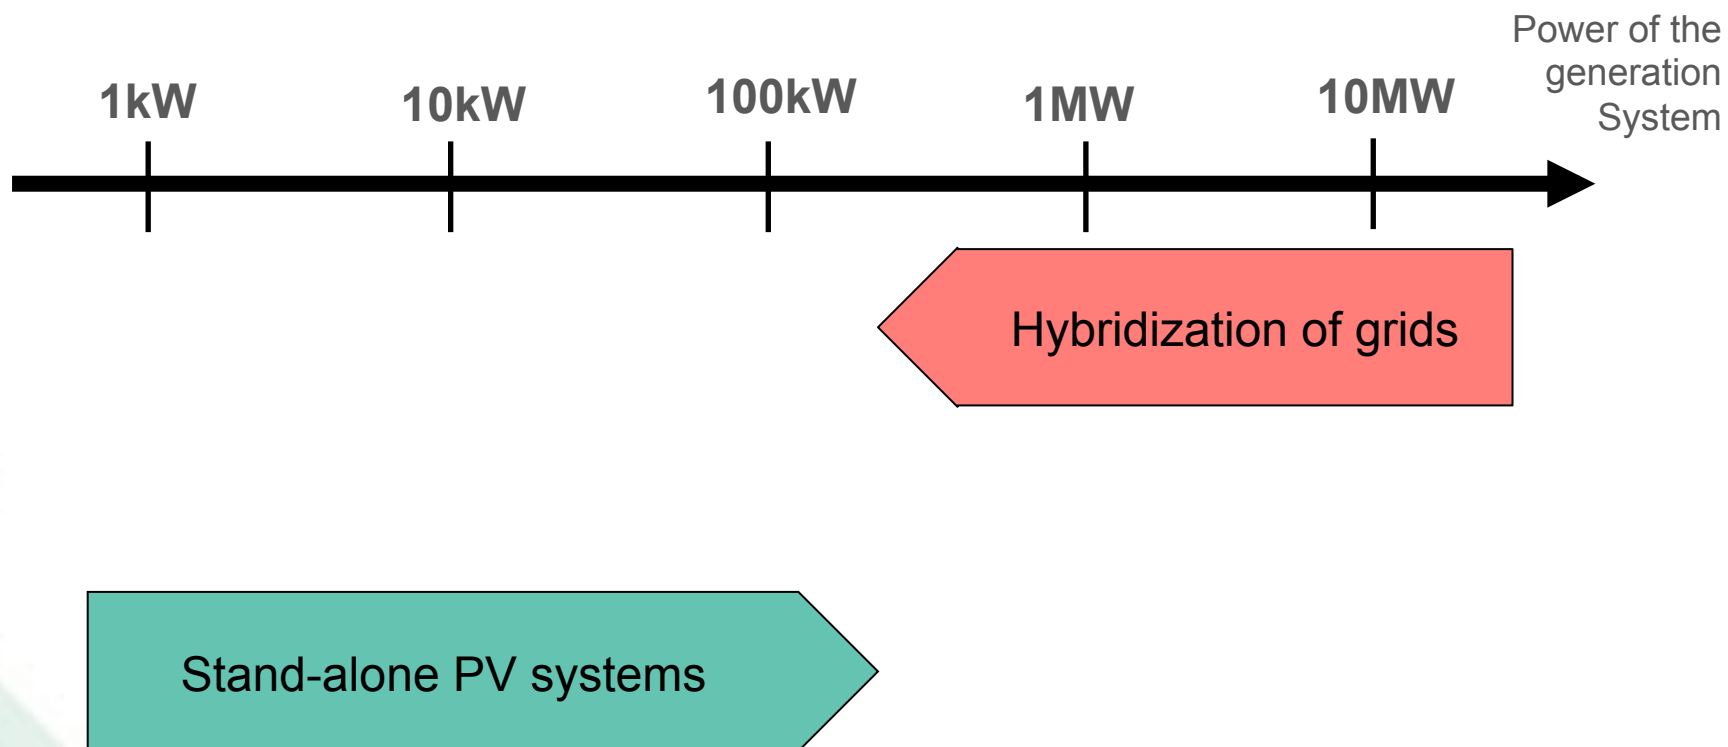

(source : U. Weissbach)

(source : Tokelau Renewable Energy Project)

Mini-grids ?

Various approaches

Mini-grids ?

Hybridization of grids

- PV system connected to a diesel genset powered micro-grid with an inverter/charger dedicated to Li-ion storage (optional)

Mini-grids ?

Hybridization of grids

- PV system connected to a diesel genset powered micro-grid with an inverter/charger dedicated to Li-ion storage (optional)
- Example : Tongatapu (Tonga)
 - Island grid powered by 14,3 MW of diesel gensets
 - 3 PV systems for a total of 4,32 MWp
 - 2 storage systems for a total of 13,2 MW/29,3 MWh storage (Li-ion)

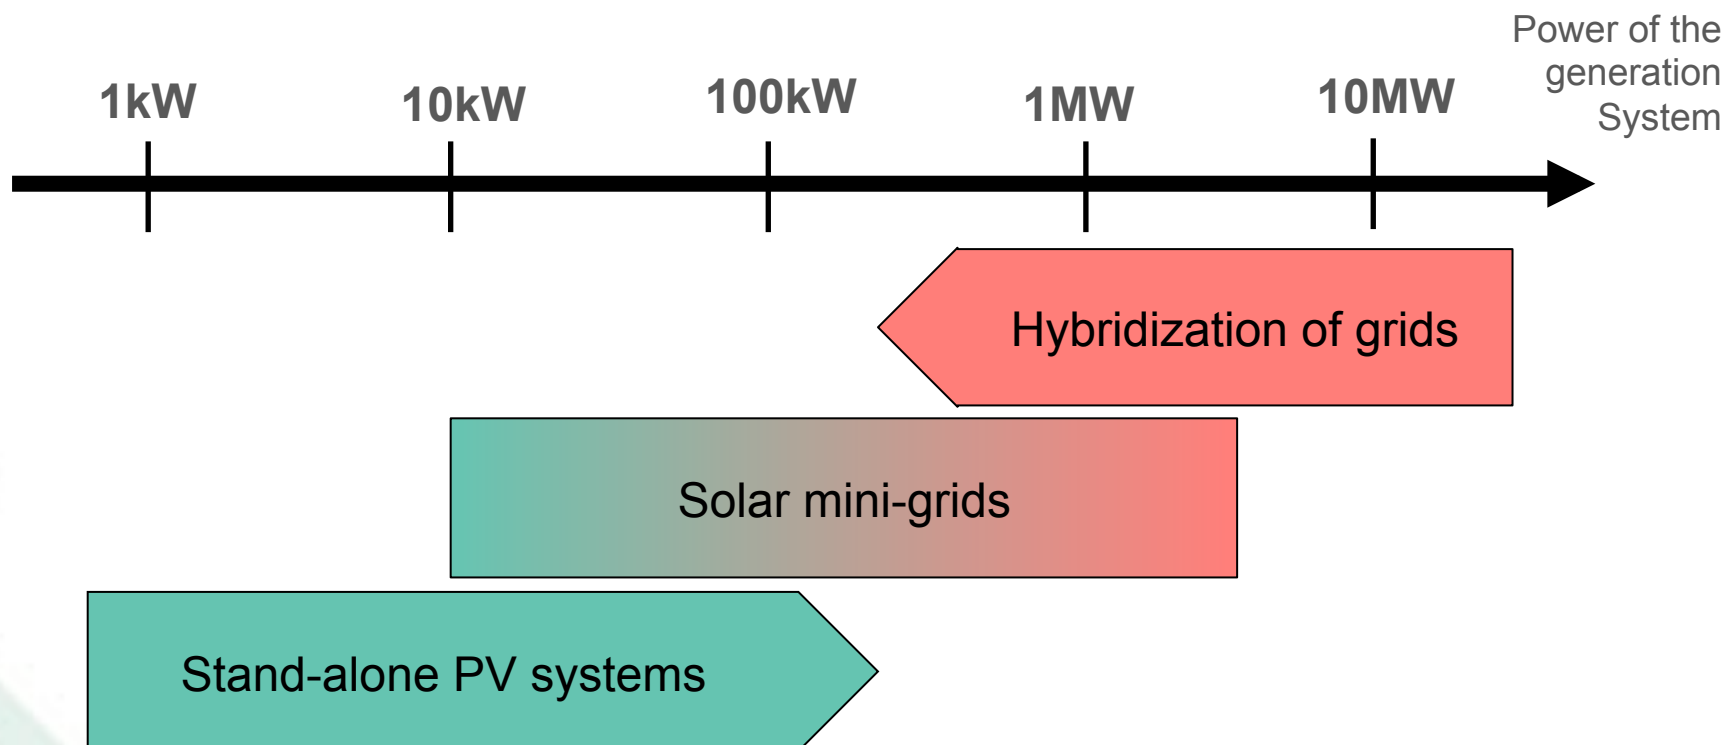

(source : Tonga Power LTD)

Mini-grids

Various approaches

Voltage drops

Basics

Voltage drops

Basics

$$\Delta U(\%) = 100 \cdot \frac{R_L}{U^2} \cdot P \cdot L$$

Voltage drop increases with :

- the linear resistance of the cable (R_L)
- the power consumed (P)
- the length of the cable (L)

Voltage drops

International standard

- **IEC 60038 - IEC standard voltages**
 - Low voltage : 230/400 V
 - *“the supply voltage should not differ from the nominal voltage of the system by more than $\pm 10\%$ ”*

Voltage drops

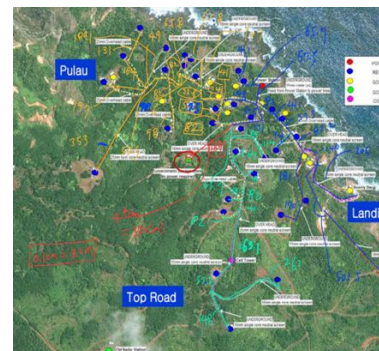

Increase cross section of the feeder

Voltage drops

Example : Adamstown (Pitcairn)

- 3 feeders
 - Pulau (North West)
 - Top Road (South West)
 - Landing (South East)

Voltage drops

Example : Adamstown (Pitcairn)

The cables are too old, and although they are not accurately measured, serious voltage drops were observed at the end point of each feeder.

Recommended cable U1000R2V or equivalent grade section are indicated as per below:

- 35mm² underground cable for a distance of 2,200m
 - Maximum power to limit voltage drop to 10% ?
 - Resistance of copper : 23,6 Ω.mm²/km
 - Resistance of cable : $23,6 \times 2,2 / 35 = 1,48 \Omega$
 - Voltage drop = 10%Un = 40 V
 - $I_{max} = \Delta U / R / \sqrt{3} = 40 / 1,48 / \sqrt{3} = 15,6A$
 - $P_{max} = U \times I \times \sqrt{3} = 400 \times 15,6 \times \sqrt{3} = \underline{\underline{10.800 \text{ Watts}}}$
