E-Mobility – Global Status

Andrew Campbell 28 November 2022

What is driving change?

- Climate Change
- Cost of fuel imports
- Local air quality
- Resilience
- Personal safety
- Convenience
- Improve level of service
- Improve quality of life
- Congestion
- Waste minimization

Smartphones

Enablers of change:

Technologies are developing rapidly ightarrow

- Falling costs
- Rapidly increasing capability of technology
- IT and IoT
- Clever combinations = new ways, providing more affordable and accessible transport
 - \rightarrow accelerated uptake of e-mobility
 - \rightarrow micro- and small-format mobility
 - \rightarrow shared vehicles
 - \rightarrow connected, on demand services
 - \rightarrow i.e., mobility as a service (MAAS).
- When will steering wheels become illegal???

Examples of new mobility options enabled by the development of modern batteries

Global trends in transportation sector:

- Priority on reducing reliance on cars
 support people to walk
 "pedestrians first", cycle, use small-format vehicles and public
 transport.
- Adoption of low-emission vehicles (including EVs).
- Decarbonization of heavy transport has begun in many countries.
- Use of Shared vehicles
- New business models developing:
 - Access to mobility via accessing services (UBER, Grab, other MAAS).
 - New B2B models: e.g., Gojek (not wanting to invest in assets) and Gogoro (providing e2W transaction and battery as a service platform) ... with potential for Gensit to manufacture and lease.
 - Integration of multiple mobility platforms (through data/IoT/clever algorithms ... e.g., balancing demand on local/grid electricity supply).

EV Global status

50x LEV regos compared with 2012

EV Global status

300 million on roads in China alone (Bloomfield)

- Many countries have focused on EV cars
- But micro/small EVs have important role:
 - large GHG/travel changes with mode shift
 - affordable e-mobility option now
 - ... requires suitable infrastructure (beyond roads).

50x LEV regos compared with 2012

The current catalogue ...

PIC "deployment ready now"

PIC "pilot-ready" (noting importance to begin transition)

e-Mobility global trends - vehicles:

- Increasing models 450 LEVs, 170 e-trucks outside of China (IEA EV Outlook 2022)
- TCO parity: already there for e2Ws/e3Ws and some commercial EVs applications, but light/heavy EV purchase price premium also a barrier:
 - → demand-side policy to bridge price differential between EVs and ICEs, including tax reduction and budget-neutral feebate programs.
 - → Local government directives: e.g., 50% delivery 2Ws to be electric by 2023, 100% PT by 2030 (Uttarakhand, India)
- Guidance on vehicle specification required: e-bikes lasting weeks only, use of lead-acid batteries, use of low quality lithium-ion batteries → intervention example: regen braking required to get subsidies in India.
- e-Mobility makes financial sense today if externality costs considered. However, difficult to introduce such due to uncertainties and little consensus on methodology and values to be used (e.g., calculated GHG reductions from e-bus charged from diesel generation ranges from 10% to 50% depending upon calculation model).

e-Mobility global trends - batteries:

- In main EV markets, improvements in battery performance used to increase LEV range in preference to same range and decreased price.
 → design for toady's Gen 2 Nissan Leafs or tomorrow's EVs?
- 1-3 year battery warranties on e2W/e3W/marine batteries a market barrier when average ownership 5-6 years. Made worse by perception that battery at its end of life after warranty expires.
- UN GTR No.22 on In-Vehicle Battery Durability adopted March'22:
 - Batteries on LEVs to lose less than 20% original capacity over five years or 100,000 km, and
 - Less than 30% over eight years or 160 000 kms.
- India and Indonesia encouraging set up of 'gigaplants' (e.g., 50GW/y battery plant in India (IEA Outlook 2022))

e-Mobility global trends - charging:

- Battery swapping expanding into many countries (providing fast "recharging" of small-format e-mobility vehicles. Provided as a service, removes battery cost from vehicle purchase, specialist entity can look after 1000's batteries from introduction to end-of-life ...).
- Importance of smart charging for grid management recognised.
- Commercial V2G emerging → use of EV batteries to support the grid becoming a reality:
 - UNIDO China-SAE GEF project.
 - Gogoro and grid integration of battery swap stations in Taiwan.
- Most sales in lighter vehicle categories where at home/work charging prevalent
 Prevalent encourage set up of charging at home, at work, parking spaces, government buildings ...
- Electricity distribution, and oil and gas companies are entering the market (e.g., Petronas and PLN in Indonesia, both charging stations and battery swapping).

Battery-swap stations and vehicles ...

Battery-swap stations and vehicles ...

Global trends – electricity supply:

- Ability to supply to e-mobility market often thought a concern:
 - Added demand only 5% in large economies (EV Outlook 2022).
 - However, added stress on local network → need for upgrades such as transformers (eg 1st CSs and Bhutan project)
 - PICs also starting from a base of small electricity demand:
 - → e-mobility demand likely to be a more significant proportion of total demand,
 - \rightarrow high levels of decarbonization to consider,
 - \rightarrow high levels of variable renewable energy to consider,
 - → plus electrification of heat (cooking) and new cooling demand (AC)
 - \rightarrow but will also take time for EV sector to develop.

Global trends marine and air:

- Electrification of marine industry rapidly evolving ...
 - 2019: there were two suppliers of >40hp_{equiv} outboards on plugboats.com portal. Yesterday there was 10.
- Many short-voyage large-vessels in commercial operation.
- Commercial (and military) drone use has been normalised.
- Electrification of aviation industries at an emerging level ...
 - 2022 has seen many maiden flights of final-design electric commercial passenger aircraft.

All very well ... but how do these fit in the PIC environment? ... and where is the plan for PICs?

- What are the transport needs for each PIC?
- What is **each country's vision** for what this looks like at 2040?
 - What is the desired vehicle fleet ... and how is it accessed?
 - What do land-based "roads" look like?
 - And at 2030?
 - How best to prepare for this → what does 2025 look like?
- Noting:
 - e-Mobility expected to be part of the solution (reason for the UNIDO/PCREEE project that developed a Regional EV Program).
 - What has not worked in the past unlikely to work going forward.
 - Expect increasing urbanization.
 - Change (and even thinking about it) will be uncomfortable to some

... how to make it happen?

Delivering ... an e-mobility project example from Bhutan ...

UNIDO project "Promoting Green Electric Mobility (E-Mobility) Solutions for Urban Transport in Bhutan and the Wider Hindukush-Himalaya Region"

- **Grid** electricity virtually **100%** renewable.
- A vision of all-electric bus fleets serving it cities.
- e-Mobility unknown → risks perceived high by the decision makers ...
 - Do e-buses work in the cold of winter and on long, steep inclines in the heat of summer?
 - Can't consider e-bus adoption, let alone plans, unless first-hand Bhutan-real-world experience and in-service data available.
 - \rightarrow e-bus pilot, specified to best provide this experience and data.
- Bus project not considered in isolation:
 - Fits with Bhutan's UN-backed GEF 300 e-taxi project.
 - Fits with other transport needs.
 - UNIDO supported study tour of RGoB officers to Vienna to look at e-mobility and broader transport-scape.
 - → with UNIDO support, redeveloping EV roadmap with considers micro- to heavy e-vehicles, and pedestrianization.

Delivering ... an e-mobility project example from Bhutan ...

oting Green Electric Mobility (E-Mobility) Solutions Bhutan and the Wider Hindukush-Himalaya Region" ually **100%** renewable.

• \rightarrow e-bus pilo

 - → with UNIDO support, redevelop micro- to heavy e-vehicles, and ped

the decision makers ... on long, steep inclines in

plans, unless first-hand e data available. experience and data

Current status:

- Procurement by the "City Bus Service" using a National Competitive Bidding process → ensuring a there is a national entity to hold responsible.
- Supplier to supply both bus and chargers ... largely avoiding purchaser involvement should any incompatibility between them be found.
- Specifications based on a 9m modern city bus (although proposed routes did not allow the use of a low-floor model) with reasonably fast charging (120kW).
- Procurement exercise won by local entity already involved in supplying EVs and chargers to Bhutan, supplying:
 - Skywell buses (build 1,000s of e-buses each year)
 - BlueSky chargers (build 1,000s of chargers each year)
- Manufacturer training of City Bus Service and local supplier, plus use of remote monitoring and diagnostic tools → the latter vital to provide expert support in deployments of new technology in new regions.

To conclude, let's revisit the PIC Regional e-Mobility Targets for 2030 (released in 2020)

Regional Electric Mobility Policy for Pacific

1. Ten different models of manufacturer-supported, mainstream EVs are available in the marketplace.

- 2. Battery swapping for low-voltage mobility use is available on a commercial scale in the marketplace.
- 3. There is good public awareness of EVs. \checkmark
- 4. 50% of all mainstream EVs are charged through devices that are managed-charging enabled.

Final, July 2020
